Microsoft IQ: why context wins the AI deal

Knowit, Nordics · 28 October 2026

Ben Gibbs

Microsoft Global Black Belt

Another week. Another model.

What changed for your customer?

In four years, AI went from talking to doing

Nov 2022	**Chat**	One RFP question. One paragraph.
Late 2024	**Reasoning**	Analyze requirements. Develop a response strategy.
Late 2025	**Agents**	Research, draft, validate, and assemble the proposal.
2026+	**Agentic enterprise**	Orchestrate the entire RFP process across people, agents, and enterprise systems.

Chat answers. An agent plans, acts and checks.

Same model. Different system around it.

78%

Claude Code harness

42%

CORE-Agent harness

Claude Opus 4.5 · CORE-Bench

Agents reproduce published scientific results by running code.

Not an RFP benchmark or Microsoft IQ test. Different harnesses; the gap is not context alone.

Your role changes as AI does more of the work

You write it	AI suggests a sentence.
You fix it	AI drafts. You edit.
You brief it	A bounded pre-study, ready for review.
You run it	Parallel work. You set the rules.

Software and consulting need different context

Software

A repository gives a working context

Tests can check many outputs

Consulting

Context crosses teams and systems

Capacity or margin can mean different things

When AI drafts and you edit, you still fill the context gaps.

Capable models are widely available.

What does this customer know that the model doesn't?

Onboarding

A new colleague gets

Laptop and access

Who's who

The project history

A buddy

An agent also needs

Relevant context

Clear access and task boundaries

Microsoft IQ

WHAT KNOWIT CAN DELIVER

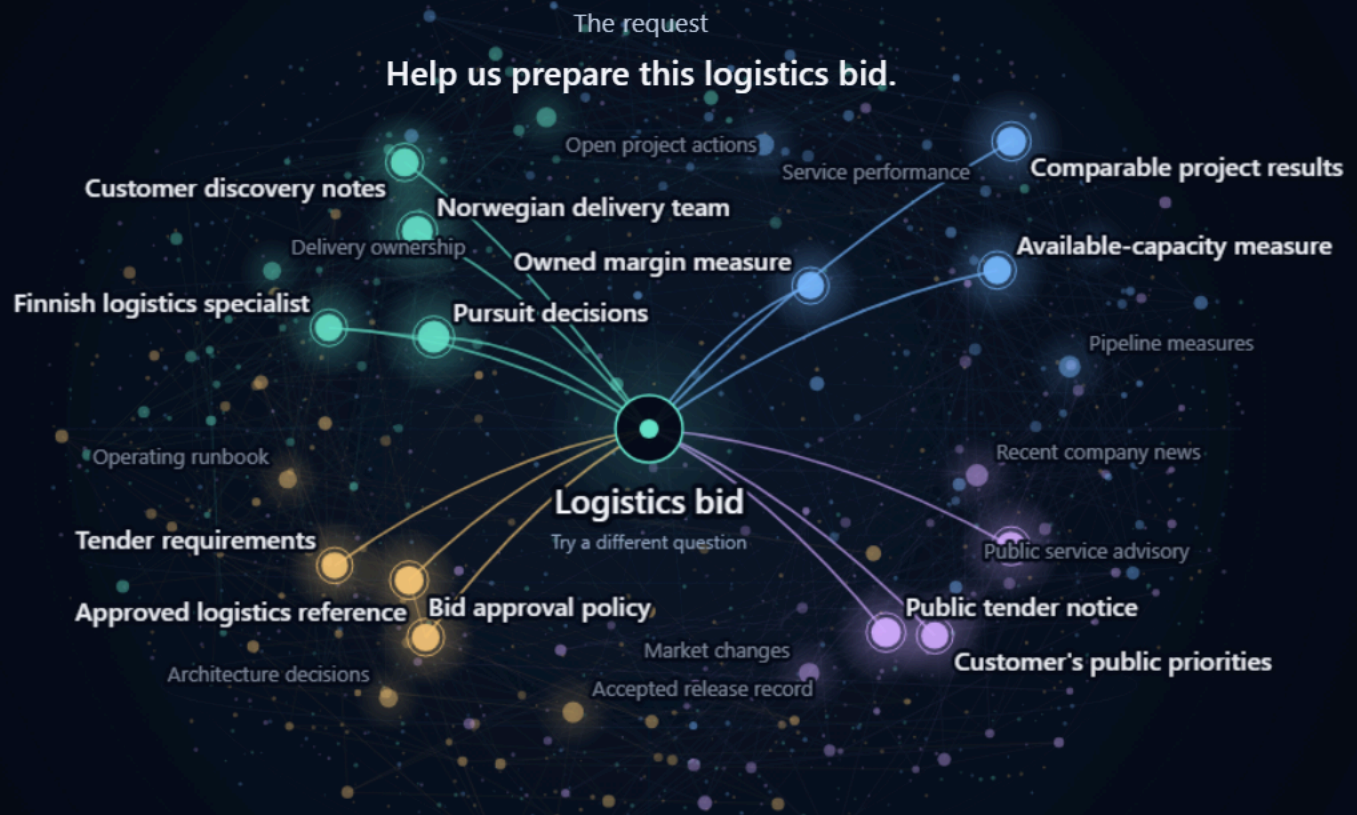

Where else could Knowit use this?

A handover needs different information from a bid. Reuse the sources that fit, with the right access.

RFP responses	Meeting preparation
Finding expertise	Project handovers
Service cases	Leadership decisions

A paid customer engagement

Connect the sources and agree the business definitions. Build the workflow and keep it working.

Change the question. A different set of information matters.

Use the capabilities the task needs. All four are not required for every project.

Work IQ	Fabric IQ	Foundry IQ	Web IQ
People & work	Business meaning & measures	Reusable chosen knowledge	Public web

Fictional Knowit example. Illustrative relationships and prepared outputs. Configured sources keep their own access controls. No live data is queried.

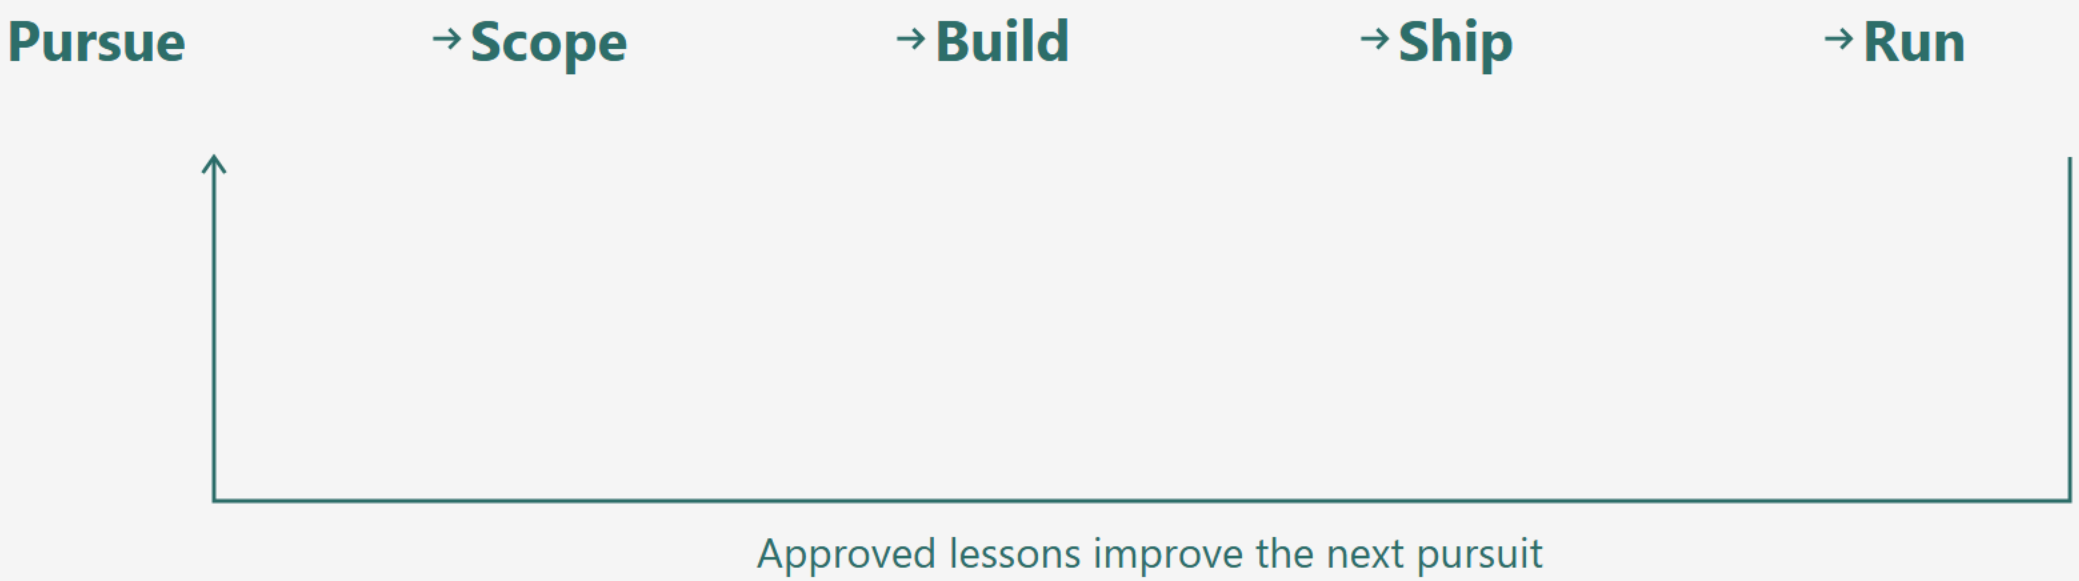

Check what's available before you promise it

Scope	The exact capability and experience
Availability	GA, preview or restricted access
Commercial terms	Licensing, usage and source connections

Verify the exact capability and terms before a customer proposal.

Knowit as customer zero

Try one repeated task. Measure useful work.

Proposed learning motion. No Knowit deployment or pilot is claimed.

One Knowit: combine what we already know

A fictional logistics pursuit

Sweden

A logistics lead

Norway

Approved delivery experience

Finland

Relevant expertise

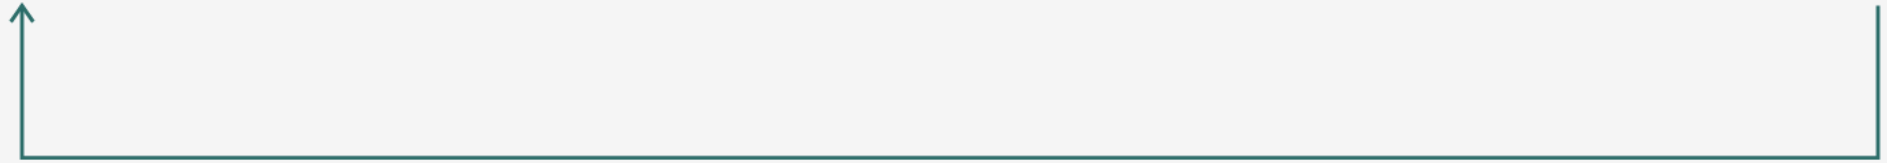

Data · Workplace · Applications

One brief, with an owner

Fictional pursuit. Sources and connections are illustrative.

Keep the context when the team changes

Pursue	→ Scope	→ Build	→ Ship	→ Run
Approved evidence and promises	Agreed outcomes and boundaries	Decisions and checks	Accepted release and ownership	Actual results improve the next pursuit

Approved lessons improve the next pursuit

Same fictional engagement. An owner at each stage.

Watch what the context does

Evidence	What context supports the answer?
Decisions	Where does a person approve?
Economics	What does it cost to run?

Over to Ben Gibbs.

Customer agent-running costs and evaluations

Find a job worth improving

What repeats?	The bid team answers the same RFP questions.
Where is the gap?	Approved evidence is spread across sources.
Who judges it?	The bid lead reviews a useful answer.

Ask the team to show today's work. A handover can be another starting point.

Choose a bounded first project

RFP answers for one bid team

Reuse the estate

M365 sources. Useful Fabric or Power BI models.

Choose for the gap

One IQ capability may be enough.

Bound the first scope

Agreed sources, cited answers, human review.

Reuse depends on supported connections, licences and configured access.

Agree the engagement before you build

Deliver	Reviewed RFP answers with citations
Own	Bid lead and source owners
Measure	Time to an approved answer, and quality
Bound	Access, approvals and expected running cost

A paid scope with an acceptance test. No assumed ROI or token-savings promise.

Which customer or project does this fit?

In the chat: customer or project + why

After today	The plays and one-pager, with one clear ask
Then	Choose one next step together

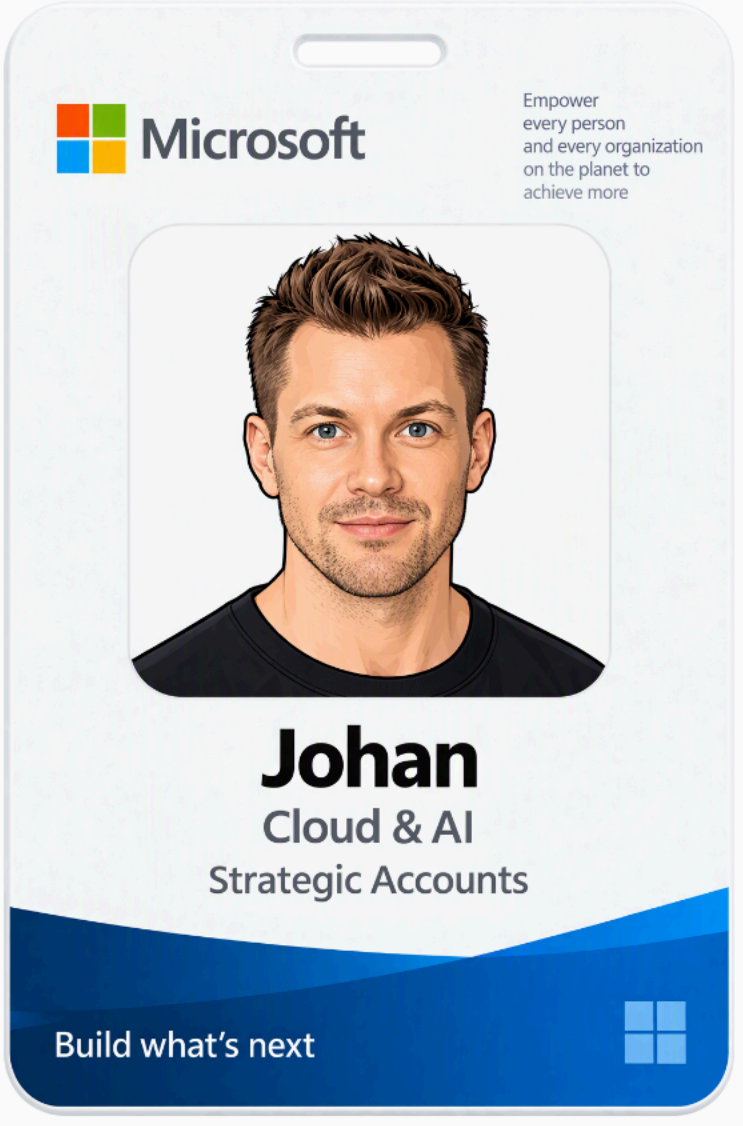

A safe description or private message is fine. No confidential detail.

Thank you
